Procedure Note: Esophagogastroduodenoscopy (EGD)

Procedure performed using the Olympus XP-190 endoscope. Patient positioned in left lateral decubitus with a standard bite block in place.

Upon entry into the oropharynx and passing the UES, the esophageal mucosa appeared normal. The Z-line was located at 38 cm from the incisors with no evidence of Barrett's esophagus.

The stomach was inspected with adequate insufflation. The fundus, body, and antrum were visualized with normal rugal folds and no erythema or erosions. The pylorus was patent.

The duodenum was examined up to the second portion and revealed normal villous architecture without evidence of inflammation or ulceration.

Findings

- Esophagus: Normal mucosa, Z-line at 38 cm
- Stomach: Normal gastric mucosa, no ulcers
- Duodenum: Normal appearance

Impression

Unremarkable EGD with no pathologic findings to explain dyspepsia.

Diagnosis List

- Chronic Dyspepsia
- GERD without esophagitis

Interventions

No biopsies or therapeutic interventions were performed during this procedure.

Endoscopy Team: Dr. Jonathan Hayes, MD (Endoscopist), Michael Greer (Assistant), Sarah Connor, RN (Circulator), Tom Andrews (Endoscopy Tech)
